Test Strategy

Test Strategy for Test Automation should concern the implementation of a feature file, using the BDD (behavior-driven development) approach which implements single scenarios, very small and detailed and which acts as an interface for the various scripts.

The scripts could start from the example file created in Java using the Eclipe tool and using Selenium WebDriver, but not necessarily.

The important thing is to build the various Steps, reuse them and join them together, up to implementing a Happy Flow, but also the various alternative or error Scenarios.

For each Step it is important, in addition to the Actions that are carried out, that the various characteristics of the landing page are verified, using selectors.
